Question1: Testing for chemicals of imported products. Make sure the imports are stopped if safe chemicals are NOT used

In this, I mean Americas' farmers are becoming more and more limited on pesticide use. Resulting in more expensive less effective ag. chemical applications.

On the other hand countries that are exporting to us can use applications off the market for US farmers and still export to the USA allowing these goods into the mouths and on the backs of Americans. How are farmers going to compete in that kind of one sided marketing?

Question2: Offer more costshare power to Beginning farmers. Quit looking at what they earn and make these new farmers commit to farming with costshare dollars. You are talking about young men and women working sometimes two jobs. So what if they make 50k together, in today's times that barely pays the bills.

Question3: Reward past performers of conservation with more conservation priority. Lower caps on payments.

Question4: Push biofuels with dollars to back up research. (INCENTIVES FOR STATIONS TO CARRY FUEL THE FIRST YEAR) Push solar powered irrigation and power on the farm. Consider THAT smaller farms can make this idea work while larger farms cannot. Address those smaller farmers.

Question5: Biofuel markets

Solar power cost share (look at how much California costshares on solar). The east coast has the same peak sun hours for panels. Why is the East Coast void of Solar energy?

Question6: see above comments.
