Question1: We need to concentrate more on Organic/Sustainable agriculture. This market is the only one expanding exponentially. We know, now, that the rest of the world is joining us in NOT wanting genetically modified organisms. There are more people in the US that do NOT want gmos than recognized but this fact is being ignored. Our government needs to recognize this and begin supporting our smaller organic farms.

Question2: We need to support our small farms is any way we can, even financially either through taxes or subsidies. BUT ONLY for SMALL farms.

Question3: We need to support our small farms is any way we can, even financially either through taxes or subsidies. BUT ONLY for SMALL farms.

Question4: The elimination or, at least, a reduction of chemical usage would be a good first start. Research is showing that foods grown without chemicals have more nutrients. This should be a priority. Chemicals in our food, land, air and water are directly contributing to health problems. These facts need to be acknowledged and appropriate action needs to be taken immediately.

Question5: We need to help farmers get off chemicals. This may sound like a simplistic approach but with the population expanding into our farming areas we must take everyone's health into consideration, not only the infrastructure.

Question6: We need to support organic/sustainable agriculture. The world is showing us we need to give up our ideas that genetically modified organisms are good for us. NO ONE wants these things including a majority of US citizens. As for the development of crops used for
