Question1: Help implement livestock and crop disease eradication programs. Help farmers produce thier products in the safeist way possible both enviromentally and health issues.

Question2: The farm policy should look at the future as more and more farmers and ranchers are getting older. The farm policy should as include incentives for young people entering the agricultural field. As a young person who one day has a dream to farm for a living this is a major impact for me. The tobacco buy out program has really hurt young people in tobacco produceing states. The farm bill should also include grants and low intrest loans to help young people enter the agricultural field.

Question3: There should be a limit on the amount of aid a farming can get. The support system should be based on a precent basis where you recive more aid based on need. Example a small farm should recive a higher precentage of aid than a large farm.

Question4: The farm policy needs to include an area to preserve farmland and reward those who are achieve conservation and enviromental goals.

Question5: The farm bill is doing a good practice at this now but there are some issues. One the farm bill should protect farmers from those moving into rural areas from urban areas. The farm bill should invest in technoliges and a farmland preservation bill.

Question6: These should be put at the top of the bill so that prices will raise and the american farmer and rancher can succeed. This is also realated to the future of agriculture.
