Question1: no comment

Question2: Our farms should be geared to providing the best quality of crops to American consumers and our dependence on foreign food should be reduced. It is not an efficient use of resources and land to mass produce a single type of crop and ship it all over the world while having a huge variety of crops shipped in.

Question3: Assistance should not rely on quantity produced nor land used. Incentives should be given for organic crops and renewable energy use.

Question4: Reduction in use of pesticides and herbicides should be encouraged and subsidized. Increased reliance on human and renewable energy resources and less reliance on fossil fuels need also occur and can be accomplished with a shift from a few large farms mass producing a single crops to many small farms producing several organic crops.

Question5: Rural areas are desperately in need of more college graduated health care professionals. Possibly more educational programs to gear students in rural areas to these fields - such as scholarships.

Question6: Organic crops and renewable energy should be highly encouraged and subsidized to promote both immediate and future health in our nation as well as eliminate our heavy reliance on fossil fuels.
