Question1: It's simple. Let a free market decide. End subsidies.

Question2: Let's get rid of trade barriers and operate as a free market.

If there is a demand for a product overseas and farmers can make money producing it then they will. I don't think the government should be telling farmers what to grow.

Question3: Again, a free market is the best way to operate. End subsidies.

Question4: With all the money we save by ending subsidies, we can research ways to grow crops without pesticides and nitrogen fertilizers that contaminate our waters.

Question5: Less government involvement is always better. What "problem" is the government trying to "solve"?

Question6: A good use of government funds would be on research especially on growing organic crops with the very minimum of fertilizers and pesticides, and sharing that research with small family farms. The big corporate farms can afford to do their own research or pay the government for the research that they do
