Question1: One way is Tax incentives issued to better Environmentally Conserved Lands should be used to offset taxes on existing Farming Lands. Next Local Towns and Cities Need incentives to offset Land cost and could help new Farmers acquire land like they do with say Strip Malls. Its is more of getting the Local and State political powers to recognize via funding the importance of Farming Land Tax Incentives.

Question2: Policy should be on Funding and Creating flexible individual Farmers. Farms across the U.S. that can grow a wider variety of agricultural products either seasonally or at the same time on the same Lands and seamlessly use there Lands in an Environmentally sustainable means. This gives Farmers the edge they will need to survive and meet market demands for any agricultural need, weather it is a "fad" or base item in the States or Over Seas. This also gives the farmer a more firm control over there own future, their choice which market to pursue instead of being stuck producing an already abundant market product.

Question3: One effective policy would be funding for preservation of Farming Families. This could be done through college grants for farmers and members of family to attend local colleges. Also family designed low interest rate loans and loans for second businesses with in the farming family members. Funds need more of a priority for Family Farming Succeeding Generations Sustainability needs than just Production.

Question4: This is the True Future of Farming everywhere in the World! Preserving the Lands is as much a top priority as any other for the future of farming, especially individual Farmers! This needs as much funding as possible! Farmers need the funds to proceed in conservation directions. If 4 out of 5 farmers in the U.S. are turned away form pre-suing this way of farming an obvious Alarm is sounding! Farmers need Money to make our lands Healthy! Farmers want to and can make it Happen!!! Give Funds Now!!! Its Time!!!

Question5: Funding needs to go to locally educating the farmers and farming families. Local Agricultural colleges and Internet Agricultural colleges. These can be setup in any local town building. That way farming families can stay together and grow with out the problems of next generations leaving the farm for education and work.

Question6: Farmers, not just corporate farms need far more access to product, market and research data. And programs to teach farmers how to use the data and create networks of individual farmers to access each others data so as to forecast and choose actions. Educating the farmers in the empowerment of access and usage of data of there markets and future markets concerning selling as well as purchasing and land financial management. Second the need for research into Sustainable Farm Lands via natural growing through organic and renewable energy means. This means more of a feature for the Farmers Own needs as well coupled with a means of selling organic crops. Research and Funding into fitting renewable energy systems into the 21-century American Farms is a Must if family farmers are to keep costs down and retain a self reliant spirit. This needs Far More Funding, how Conserved Lands are to be

tended and the Farmers economic stability are maintained through proven Renewable Energy Systems that Farmers would take to like a duck to water.
