Question1: The farm policy should give opportunity to farmers in working and utilizing available farm land if they implement a sustainable, low-impact environmentally friendly farming practices - they should get a price break.

Question2: We need to produce and support the production of bio-diesel crops in our country to displace our reliance on fossil fuels. We would be providing a product that we would need and it should be cost effective to produce inside our country.

Question3: Again, smaller, niche farms should be given assistance for their stewardship of the land (if they are doing so) rather than basing policy on size and amount of production.

Question4: Provide education and reward those who are achieving conservation and environmental goals with monetary assistance

Question5: The programs should support the rural and farm programs by showing (rewarding) the benefit of the industry to the immediate community - coops for equipment use, seeds, fuel and product consumption within the community would be self perpetuating. Offering \$ assistance to make happen should be explored.

Question6: Money toward these activities must be earmarked, and this should include urban forestry in our urban communities. these innovative and beneficial programs are currently supported by urban forestry/ city programs and we need the money to continue there as well.
