Question1: there should be measures enacted to limit the hugh "factory farms" that are owned by corporations.

Question2: with mad cow disease and now avian flu -- the country that spends time and money ensuring respect for animals and quality environments for them will result in cleaner, healthier animals. high standards for limiting risk of contaminants in the food will also be important as the rates of e-coli, etc. have increased.

Question3: a long hard look at the climate and environment where the farms are located. water water water is the biggest concern. we should not subsidize crops grown where they waste water. cutting water subsidies will force better growing practices.

Question4: by allowing farms to grow the most environmentally friendly crops. by limiting pesticides drastically. by reducing water subsidies to farms which are growing crops unsuited for their region.

Question5: by looking at new ways of growing - hydroponics is a way. by providing information on what to grow that is sutied for that farm's environment.

Question6: there should be provisions for increasing fallow land - to let land rest, to provide more wildlife areas, increased acres to support migrating birds and other animals. to turn away from the horror of the factory farm which incarcerates animals. to support the honest, careful farmer who acts as a steward of the land.
