Food Loss and Waste: A Multi-Billion Dollar Opportunity

Tara H. McHugh

Center Director

USDA. Agricultural Research Service

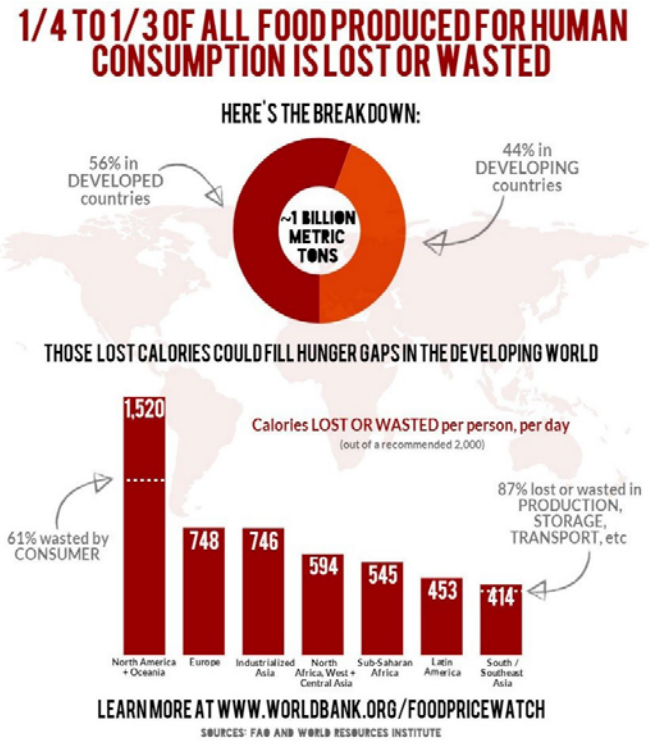
Western Regional Research Center, Albany, CA

The Challenge

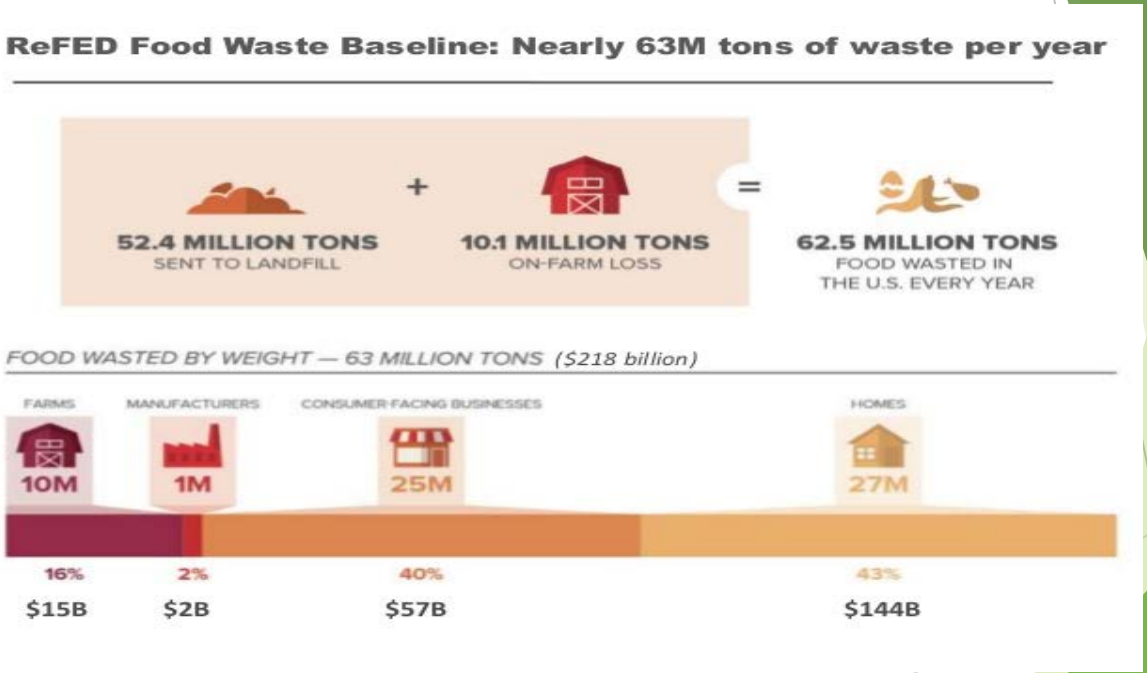
Every year, American consumers, businesses, and farms spend $218 billion a year, or 1.3% of GDP, growing, processing, transporting, and disposing food that is never eaten. That's 52 million tons of food sent to landfill annually, plus another 10 million tons that is discarded or left unharvested on farms.

Meanwhile, one in seven Americans is food insecure.

Global Issue

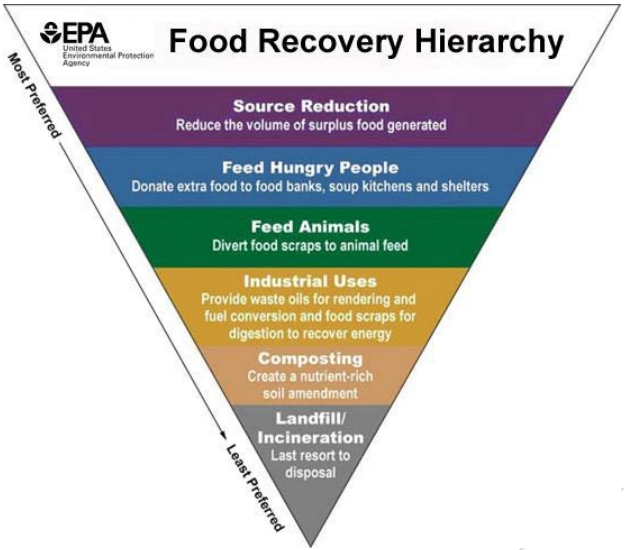


63 Million Tons ($218 B) Annually in United States



U.S. Food Waste Challenge

USDA and EPA
U.S. Food Loss and Waste 2030 Champions



Agricultural Research Service

2000 Research Scientists, 90+ Research Locations, $1.4 B

Mission: Conduct research to develop and transfer solutions to agricultural problems of high national priority.

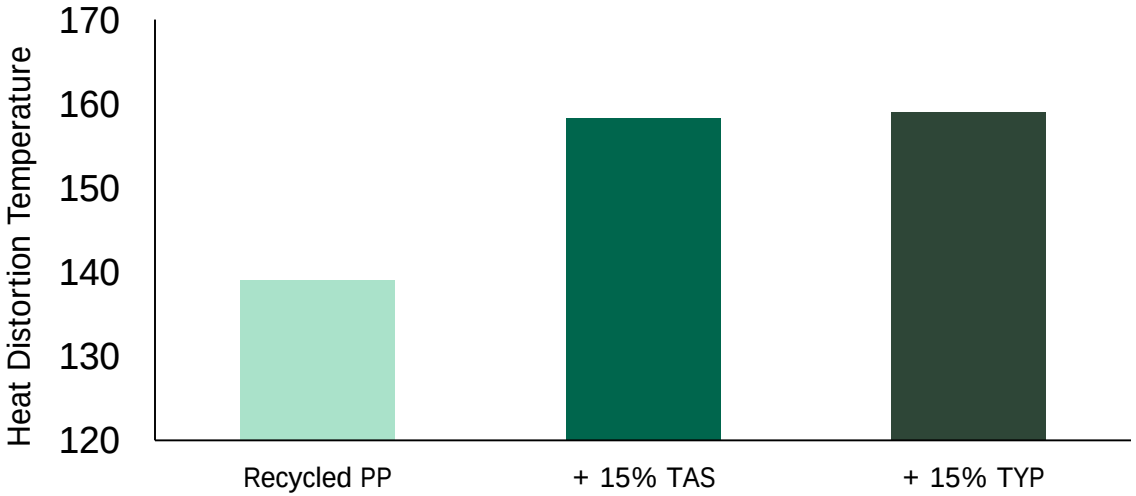
Torrefied Biomass Increases Melt Temperature



Sun-Damaged Nursery Pots

Almond Shells Heat Treatment

Torrefied Almond Shell as Additive to Recycled Plastics

+ Polypropylene

+ Polyethylene terephthalate (PET)

Material advantages of adding torrefied almond shells:

- Provides color, displacing carbon as pigment
- Increases tensile modulus, making the final product more rigid, a property often lost in recycled plastics
- Increases heat deflection temperature, meaning that the composite material is more heat-tolerant

Shipping Pallet Production

15% Torrefied Biomass plus recycled plastic at TranPak, Fresno, CA

Small fruit/berry food loss

Estimated over $3B in U.S. in 2018

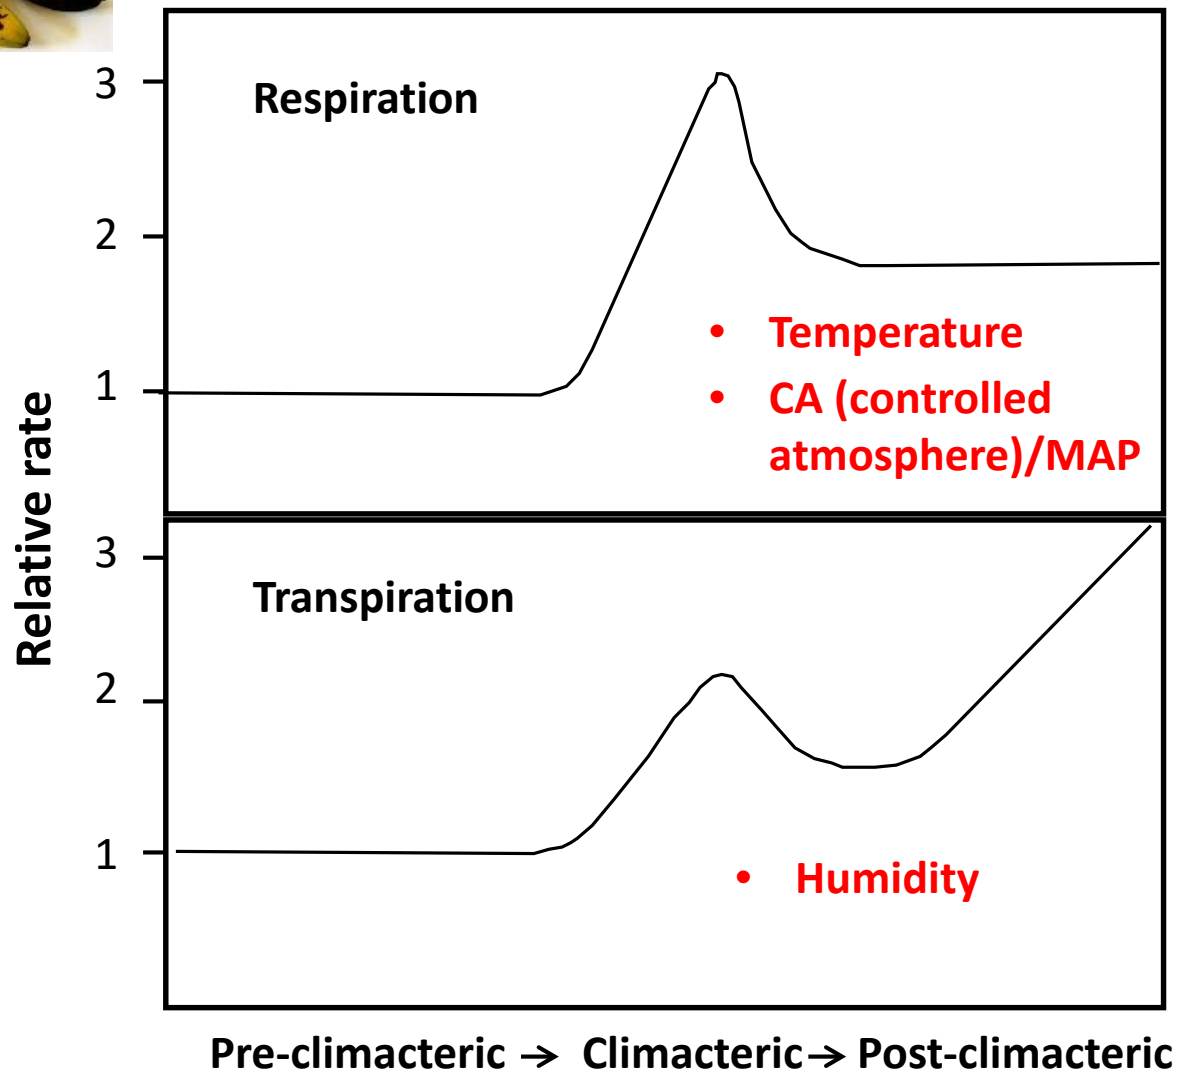
Fresh market value $11B; Retail food loss 9.3% ($1B); Consumer food loss (kitchen) 19.4% ($2B)

https://www.cookinglight.com/ PHOTO: GETTY: CARSTEN SCHANTER / EYEEM

https://www.3dstreaming.org/3d-media/videos/7883-rotting-fruits-decay-time-lapse-3d-full-hd-fast-and-reverse-version.html

Data from: USDA-NASS, 2018

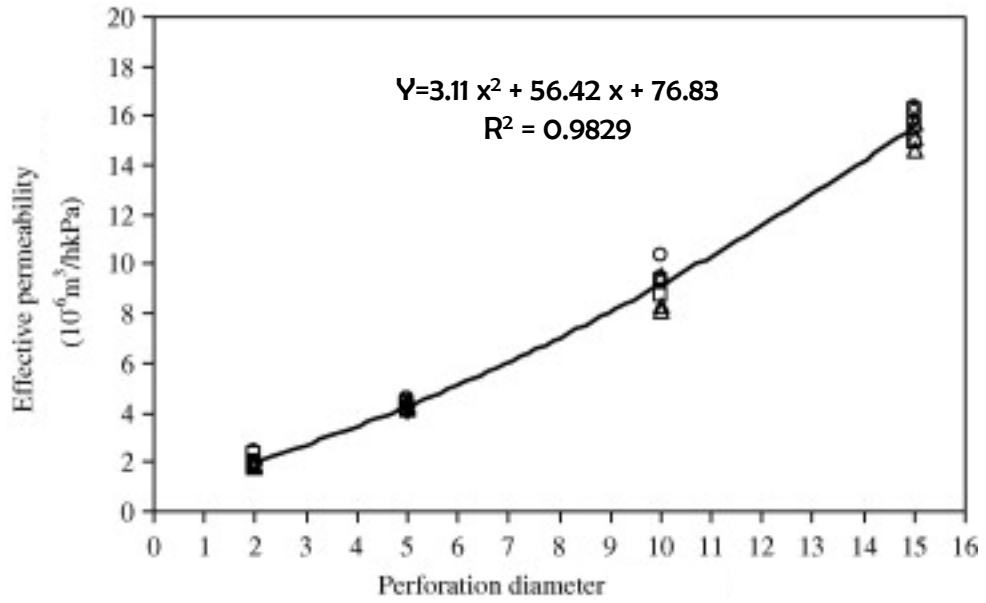
Humidity is one of the key factors in fresh fruit preservation, which has been underestimated

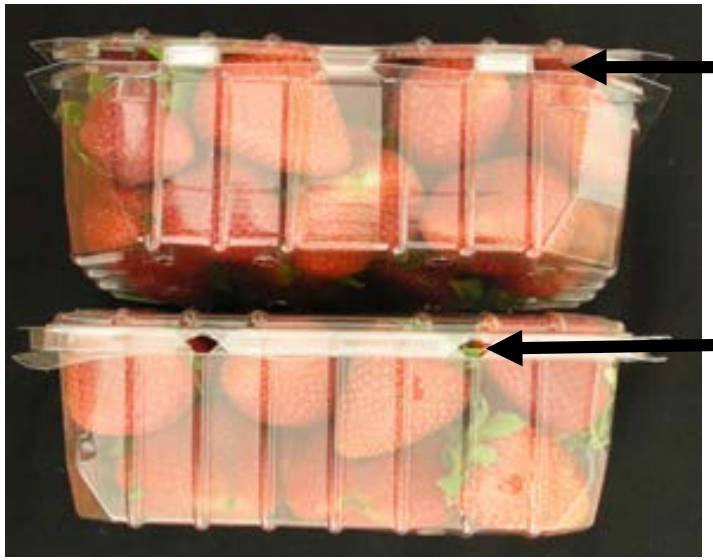


- In a CA system, preventing water loss has proved to be more important and cost-effective than controlling the gaseous environment (Ben-Yehoshua, 1989; Burg, 2004; Rodov et al., 2010)
- Apples (Lentz and Rooke, 1964) and bananas (Wardlaw and Leonard, 1940) lose water at a significant rate even when the relative humidity (RH) of the surrounding air is 100%.
- Many research reports describe the RH as 85-95%, implying that humidity is not a problem or that if greater than 85%, there is no problem. There is little data on whether there is the difference in produce response to RH of 90%-95% compared to 85% for example?

Adapted from Burg, S.P. 2004. Postharvest physiology and hypobaric storage of fresh produce. p240

Super simple technology – reduce perforation/openings





Commercial clamshell with wide vents

New clamshell with 84% reduced vents

- The model was built based on mathematics/aerodynamics
- Field tests were run in > 10 fruits, > 10 years in three countries

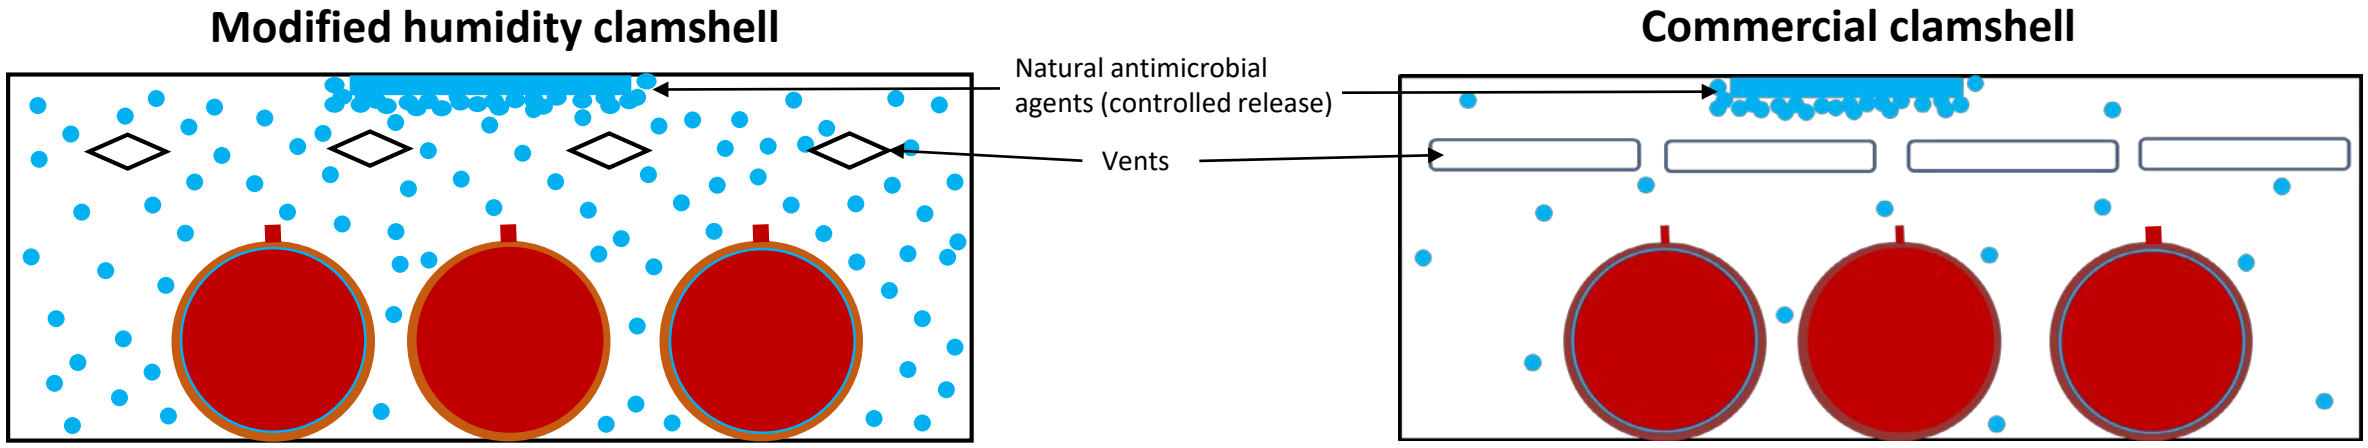
Conclusion: Water loss in the commercial clamshells was 1.2–4.5-fold more than for the new clamshell

Several Reinforcements:

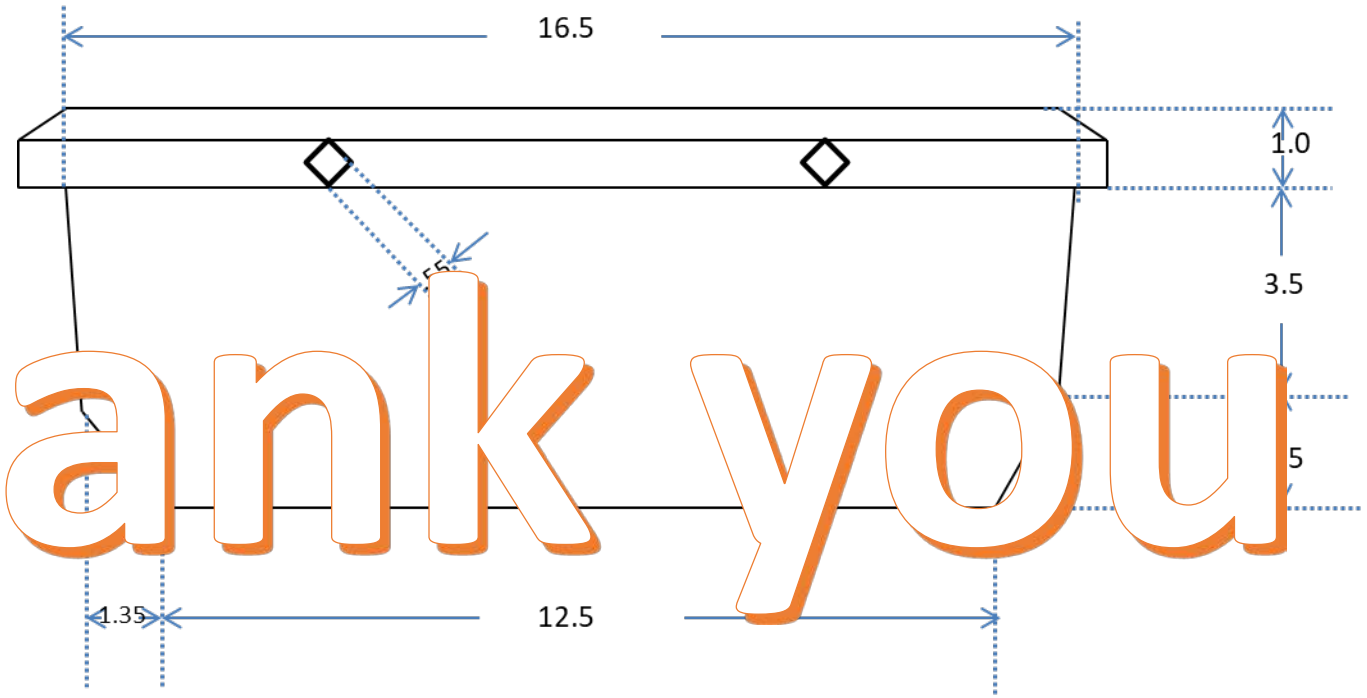
www.mnn.com

- Compostable packaging - adding citrus juice processing waste and other waste pectin to plastic polymers
- Antifog processing – prevent condensation caused contamination
- Combine packaging with controlled-release natural antimicrobial agents

Foodengineeringmag.com



Integrated packaging technology combining humidity control and slow release antimicrobials to prolong freshness and improve safety of small fruits and berries



Thank you ☺
