Reliability of May Projections 1/

Note: Tables on pages 35-37 present a record of the May projection and the final Estimate. Using world wheat production as an example, the "root mean square error" means that chances are X out of X that the current forecast will not be above or below the final estimate by more than X percent. Chances are 9 out of 10 (90% confidence level) that the difference will not exceed X.X percent. The average difference between the May projection and the final estimate is XX.X million tons, ranging from X.X million to XX million tons. The May projection has been below the estimate XX times and above XX times.

	Differences between forecast and final estimate
